

**Disease**

# Hypogonadotropic hypogonadism 8 with or without anosmia<sup>1, 2, 3</sup>

**Gene**

**KISS1R**

|                                                 |                                                                                                                                                                                                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inheritance</b>                              | AR                                                                                                                                                                                                |
| <b>Current Treatments</b>                       | FSH (follicle-stimulating hormone); hCG (human chorionic gonadotropin); LH (luteinizing hormone) - only males                                                                                     |
| <b>Evidence for Treatment</b>                   | expert opinion                                                                                                                                                                                    |
| <b>Non-Molecular Testing Availability</b>       | yes                                                                                                                                                                                               |
| <b>Non-Molecular Test</b>                       | At one to three months of age. Serum FSH, LH, Testosterone, Inhibin B in males. FSH, LH, Inhibin B in females. <sup>3</sup>                                                                       |
